

ASSESSMENT

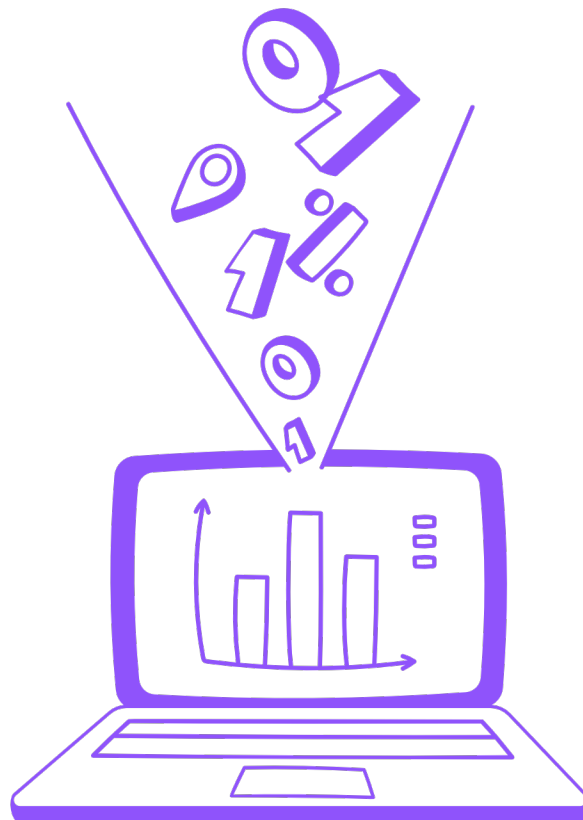

Feasibility Questionnaire

Introduction

This EasyCoder feasibility questionnaire is a tool used to assess the viability of your generative AI initiative before significant resources are committed. It consists of a series of questions designed to gather insights into various aspects of the generative AI solution you would like to build, such as technical requirements, goals, strategy, and data preparedness.

By evaluating responses, the questionnaire helps our team understand the potential challenges and benefits associated with the project. The goal is to ensure that the project is realistic, viable, and likely to succeed, providing a data-driven foundation for proceeding with confidence or reconsidering the investment. This process is crucial in minimising risk and optimising resource allocation in project management and business development.

Initial Assessment

Primary Goal: To identify and narrow down the key business priorities and performance metrics to address through generative AI.

What is your vision for AI/ML and your company? Do you have an existing generative AI strategy or strategy?

What are some of your industry-specific generative AI trends and investments you see that are most exciting? Where do you see risks for your business?

Are there specific strategic advantages you believe can be gained by quickly adopting generative AI?

Are there any potential business risks, such as market disruptions, that are top of mind if you do not adopt generative AI?

(Ex. outdated infrastructure, high cost operations, or a poor customer experience)

What is the business strategy for this year and next? Are there any areas you see where AI can bolster the expected business outcomes?

What are your customers current pain points? Where can AI enhance the customer experience? What are the activities that encourage cross- sell & up- sell, increase customer satisfaction or NPS scores or increase conversion rates?

What are some internal processes that are labor intensive and repetitive?

What are the pain points for your employees?

What processes are currently outsourced or not core areas of specialisation for your teams?

What security or compliance requirements does your company have to adhere to in relation to AI models?

Data Assessment

Primary Goal: To understand the current data strategy and how it will influence the implementation.

What data sources do you currently have access to that we can leverage to train the AI model?

Are there any limitations that come to mind in terms of the data that could affect the AI solutions effectiveness?

Data quality - Are there any concerns about data accuracy , completeness, or consistency that need to be addressed?

Data governance - What are your data governance policies that we should know about?

Thank You

You can send the completed questionnaire to **Hi@Easycoder.co** and our team will reach out to discuss the next steps.
